Mac OS X 10.10.4 - Turnado.Q: Arithmetic on a struct I have a function $f(x,y)$ I want to write that takes two dimensions as parameters. The first dimension is what is known as y , so it is smaller than x . The second dimension, x , is always even. The $f(x,y)$ should return a value which is simply y/x . How do I do this? I could always do it with 2 for loops, but is there a more elegant way? A: No, there's no builtin arithmetic type/operation. Simply do it the normal way and use the result A: Well, you could use the ordinary arithmetic operators to compute, i.e. $f(x,y) = y/x$, or $f(x,y) = x*y/x$. Op-ed: We keep Americans safe in spite of Trump — but what would happen if he actually cut all these dangerous programs? After the Obama administration has reduced U.S. military efforts to burn, bruise, lacerate and maim hundreds of thousands of innocent men, women and children around the globe, how can we trust President-elect Donald Trump to make America safer? The truth is, that hardly anyone can trust Trump or anyone else, for that matter. But even if he starts making good decisions, we must ask: Could he actually get us out of the current dangerous place that Washington has thrust us into? More dangerous than any war, perhaps, are the bureaucratic, procedural and political obstacles to real reform that get in the way of change. These obstacles result, for example, from the fact that the two parties are largely self-perpetuating, with insular power centers on the Republican and Democratic sides. Trump's pledge to "drain the swamp" is a way of saying, let's kick out the corrupt and professionalized careers of the political class, at least at the top, and replace them with Republicans and Democrats who value the common good over their own self-interests. However, Congress and federal agencies have a long history of promoting a national policy that is antithetical to the people f678ea9f9e
